

A PRACTICAL ECOSYSTEM DIRECTORY / OCTOBER 2026

Agentic AI Frameworks and Platforms

A complete, easy-to-read guide to open-source tools, commercial platforms, low-code builders, specialized agents, and production support tools.

38	Open-source frameworks / SDKs
30	Commercial and enterprise platforms
20	Low-code / no-code platforms
15	Recommended learning priorities

Who is this for? Students, AI engineers, architects, startup teams, and trainers who want a clear view of the Agentic AI ecosystem.

How to use this guide: Start with the four categories, review the tool lists, then use the learning-priority table to decide what to study first.

Content note: This is a clear-English rewrite of the list supplied for this guide. Names and groupings are retained. It is not a live audit of every project's license, maintenance status, or market share.

Understanding the four main categories

Before choosing a tool, understand what type of product it is. Many products belong to more than one category.

Category	Simple meaning	Example need
Framework / SDK	A programming toolkit you use to build agents in languages such as Python, JavaScript, Java, Go, or .NET.	Building your own AI agent application.
Agent orchestration framework	Tools to coordinate several agents, call tools, manage state and memory, and run workflows.	Running research, analysis, and approval steps together.
Managed agent platform	A hosted service that helps you create, deploy, scale, monitor, and manage agents.	Deploying agents with cloud security and operations.
Low-code / no-code platform	A visual builder that lets you connect steps and tools with less programming.	Creating automations with drag-and-drop workflows.

Important distinction

A framework gives developers building blocks. A managed platform runs and operates the finished system. A low-code builder makes development more visual. Some companies offer all three.

Contents

- 01 Open-source frameworks and SDKs
- 02 Commercial and enterprise platforms
- 03 Low-code and no-code platforms
- 04 Specialized Agentic AI tools
- 05 Supporting tools for production systems
- 06 Top 15 learning priorities
- 07 Suggested course path and source links

01 Open-source frameworks and SDKs

These are code-first tools for building agents. They can help with tool calling, state management, workflows, and multi-agent collaboration. Listed languages are the primary ones mentioned in the source material.

#	Framework / SDK	Organization	Main languages
1	LangGraph	LangChain	Python, TypeScript
2	LangChain Agents	LangChain	Python, TypeScript
3	Deep Agents	LangChain	Python, TypeScript
4	CrewAI	CrewAI	Python
5	OpenAI Agents SDK	OpenAI	Python, TypeScript
6	Google ADK	Google	Python, Java, Go, TS
7	Microsoft Agent Framework	Microsoft	Python, .NET
8	AutoGen	Microsoft	Python
9	AG2 (AutoGen fork)	AG2 community	Python
10	Semantic Kernel	Microsoft	C#, Python, Java
11	LlamaIndex	LlamaIndex	Python, TypeScript
12	LlamaIndex Workflows	LlamaIndex	Python, TypeScript
13	Pydantic AI	Pydantic	Python
14	Agno	Agno	Python
15	smolagents	Hugging Face	Python
16	Strands Agents SDK	AWS / community	Python, TypeScript
17	Mastra	Mastra	TypeScript
18	Haystack Agents	deepset	Python
19	BeeAI Framework	IBM / community	Python, TypeScript
20	CAMEL-AI	CAMEL	Python
21	MetaGPT	DeepWisdom	Python
22	ChatDev	OpenBMB	Python
23	AutoGPT	Significant Gravitas	Python
24	BabyAGI	Community	Python

#	Framework / SDK	Organization	Main languages
25	Letta (MemGPT)	Letta	Python
26	DSPy	Stanford NLP	Python
27	Atomic Agents	Community	Python
28	ControlFlow	Prefect	Python
29	TaskWeaver	Microsoft	Python
30	AgentScope	Alibaba	Python
31	AgentScope Runtime	Alibaba	Python
32	AgentLite	Community	Python
33	Langroid	Langroid community	Python
34	Swarms	Swarms	Python
35	Eino	CloudWeGo / ByteDance	Go
36	ADK-Go	Google	Go
37	Spring AI	Spring ecosystem	Java
38	LangChain4j	Community	Java

2026 Microsoft ecosystem note

Microsoft Agent Framework is described in the source material as the newer unified direction for AutoGen and Semantic Kernel. AutoGen is described as being in maintenance mode. For new Microsoft-based projects, evaluate Microsoft Agent Framework first.

Remember: These tools do not all solve the same problem at the same level. Some focus on agent execution, others on workflows, memory, or broader AI applications.

02 Commercial and enterprise agent platforms

These products help teams develop, host, deploy, manage, or integrate agents. Some have open-source SDKs, while their hosted services or enterprise features may be commercial.

#	Platform / service	Company
1	OpenAI Agent Builder / AgentKit	OpenAI
2	OpenAI Responses API / Hosted Tools	OpenAI
3	Claude Agent SDK / Claude Code Runtime	Anthropic
4	Amazon Bedrock Agents	AWS

#	Platform / service	Company
5	Amazon Bedrock AgentCore	AWS
6	Microsoft Foundry Agent Service	Microsoft
7	Copilot Studio	Microsoft
8	Vertex AI Agent Builder / Agent Engine	Google Cloud
9	Gemini Enterprise	Google Cloud
10	Salesforce Agentforce	Salesforce
11	IBM watsonx Orchestrate	IBM
12	ServiceNow AI Agent Studio	ServiceNow
13	Oracle AI Agent Studio	Oracle
14	SAP Joule Studio	SAP
15	UiPath Agent Builder	UiPath
16	Automation Anywhere AI Agent Studio	Automation Anywhere
17	Workday Illuminate Agents	Workday
18	NVIDIA AI Enterprise Agent Toolkit	NVIDIA
19	Databricks Mosaic AI Agent Framework	Databricks
20	Snowflake Cortex Agents	Snowflake
21	Palantir AIP	Palantir
22	LangSmith Deployment	LangChain
23	CrewAI AMP	CrewAI
24	LlamaCloud	LlamaIndex
25	Relevance AI	Relevance AI
26	Stack AI	Stack AI
27	Dust	Dust
28	Writer Agent Builder	Writer
29	Kore.ai AI for Work	Kore.ai
30	Cognigy.AI	Cognigy

Simple rule: Choose a managed platform when your team needs hosted infrastructure, security controls, monitoring, integrations, or enterprise administration.

03 Low-code and no-code platforms

These products make it easier to build agent workflows using visual editors, connected tools, templates, and automation steps. Some still allow custom code.

#	Platform	Type in supplied list
1	n8n	Source-available / commercial
2	Dify	Source-available / commercial
3	Flowise	Open-source core
4	Langflow	Open source
5	RAGFlow	Open source
6	Rivet	Open source
7	Activepieces	Open-source core / commercial
8	Botpress	Commercial
9	Voiceflow	Commercial
10	Zapier AI Agents	Commercial
11	Make AI Agents	Commercial
12	Gumloop	Commercial
13	Lindy	Commercial
14	Relevance AI	Commercial
15	Stack AI	Commercial
16	AgentGPT	Open-source project
17	SuperAGI	Open-source project
18	AutoGen Studio	Open-source visual tooling
19	LangGraph Studio / LangSmith Studio	Developer tooling
20	Google Vertex AI Agent Builder	Managed commercial

Licensing reminder: Open source and source-available are not always the same. Check the product license and commercial restrictions before using any platform at work.

04 Specialized Agentic AI tools

Not every agent tool is a general-purpose framework. Some are made for a specific task, such as browser use, code generation, voice calls, or persistent memory.

Area	Frameworks, SDKs and tools
Browser automation agents	Browser Use, Stagehand, Skyvern, LaVague
Computer-use agents	Open Interpreter, OpenHands, UI-TARS, Agent S2
Coding agents	OpenHands, SWE-agent, Aider, Cline, Roo Code, Continue, Claude Agent SDK, GitHub Copilot SDK
Voice agents	LiveKit Agents, Pipecat, Vocode, Retell AI, Vapi
Research agents	GPT Researcher, STORM, DeerFlow, LangChain Open Deep Research
Memory-focused agents	Letta, Mem0, Zep / Graphiti
Multi-agent simulation	CAMEL, AgentVerse, AgentScope, MetaGPT, ChatDev
Java ecosystem	Spring AI, LangChain4j, Semantic Kernel
JavaScript / TypeScript	Mastra, Vercel AI SDK, LangGraph.js, Google ADK, OpenAI Agents SDK
Go ecosystem	Eino, Google ADK Go

Examples: Use a browser agent to interact with websites; a coding agent for software tasks; a voice agent for spoken conversations; and a memory service to help agents store and retrieve long-term information.

05 Tools that support production agents

A working agent needs more than a framework. Real applications also need logging, evaluation, memory, security controls, and integrations.

Layer	Technologies	Why it matters
Agent communication	MCP, A2A, AG-UI	Ways for agents, tools, and user interfaces to communicate.
Observability	LangSmith, Langfuse, Arize Phoenix, AgentOps, Braintrust	Track runs, traces, errors, and agent behavior.
Evaluation	Ragas, DeepEval, promptfoo, OpenAI Evals, TruLens	Test answer quality and system behavior.
Guardrails	NeMo Guardrails, Guardrails AI, LLM Guard, Lakera Guard	Check and control inputs, outputs, and policy rules.
Memory	Mem0, Zep, Graphiti, Letta	Store and retrieve useful information across interactions.

Layer	Technologies	Why it matters
Agent sandboxes	E2B, Daytona	Run agent-generated code in controlled environments.
Workflow orchestration	Temporal, Prefect, Dagster, Apache Airflow	Schedule, run, coordinate, and recover larger workflows.
Prompt optimization	DSPy, TextGrad	Improve prompts and program behavior using optimization methods.
Agent integration	Composio, Arcade, MCP servers	Connect agents to external tools and services.

Production lesson: A great agent framework cannot replace testing, monitoring, access control, safe tool execution, or good system design.

06 Suggested top 15 learning priorities

This is the learning and production priority list from the supplied material. It is **not** an independently measured market-share ranking.

Rank	Framework	Best-fit learning or use case
1	LangGraph	Complex production agents
2	OpenAI Agents SDK	Tool calling, handoffs, multi-agent applications
3	CrewAI	Role-based multi-agent teams
4	Google ADK	Google Cloud / Gemini-oriented agents
5	Microsoft Agent Framework	Azure / .NET enterprise agents
6	Pydantic AI	Type-safe Python agents
7	LlamaIndex Workflows	RAG and document-focused agents
8	Strands Agents	AWS-native agent development
9	Agno	Agent teams, tools, and memory
10	Mastra	TypeScript production agents
11	smolagents	Lightweight code agents
12	Claude Agent SDK	Coding and computer-tool agents
13	Haystack	Retrieval-heavy agents
14	BeeAI Framework	Multi-agent applications
15	Letta	Persistent-memory agents

07 A simple learning plan

For an Agentic AI course, you do not need to teach every framework in equal depth. Start with a small group of widely useful architectures, then introduce specialized tools.

Core frameworks to teach in practical classes

- **LangGraph:** Learn graphs, state, routing, memory, persistence, and human approval.
- **OpenAI Agents SDK:** Learn agent loops, tools, handoffs, and execution tracing.
- **Google ADK:** Learn agent hierarchies and different workflow patterns.
- **CrewAI:** Learn roles, tasks, crews, and business-oriented flows.
- **Microsoft Agent Framework:** Learn enterprise agent orchestration and .NET/Azure integrations.

Other useful frameworks to include

Pydantic AI, LlamaIndex, Agno, and Strands Agents add more options for type-safe agents, retrieval-heavy applications, agent teams, and AWS-oriented projects.

Enterprise platforms comparison module

Compare **Amazon Bedrock AgentCore**, **Microsoft Foundry Agent Service**, **Google Vertex AI Agent Engine**, and **Salesforce Agentforce**. Explain how a framework differs from a managed hosting and operations platform.

How to choose a tool

- **Building with code?** Start by comparing frameworks and SDKs.
- **Running on a large cloud platform?** Evaluate managed agent services.
- **Automating work visually?** Look at low-code and no-code builders.
- **Building a specific agent, like browser or voice automation?** Look at specialized tools.
- **Running in production?** Add observability, evaluations, access controls, and safe execution.

Helpful sources and further reading

[LangChain: AI agent frameworks overview](#)

The GitHub repository link above was checked. Other tool listings and their stated licenses were preserved from the supplied text rather than independently audited.

Final takeaway: No single framework is best for every project. Choose based on your application, development language, orchestration needs, cloud environment, security requirements, and your team's skills.

Prepared in simple English from the source material supplied in the conversation. Current product names and commercial terms can change over time.
